EXPERIMENT 10

CS23334 – FUNDAMENTALS OF DATA SCIENCE LAB

NumPy Array Functions

Aim: Create, reshape and perform operations on NumPy arrays.

Python Program

```
import numpy as np
a=np.random.randint(1,100,9)
print(a)
print(np.sqrt(a))
print(a.ndim)
b=a.reshape(3,3)
print(b)
print(b.ravel())
print(b.shape)
print(b[0:2,0:2])
```

Result

A 1D array is created, reshaped into 3×3, flattened and indexed.

Note: For CSV programs, keep the named CSV file in the same folder and check that column names match.
